Expression and characterization of baculovirus expressed herpes simplex virus type 1 glycoprotein L.

Ghiasi H, Kaiwar R, Slanina S, Nesburn AB, Wechsler SL.

Cedars-Sinai Research Institute, Los Angeles, California.

We have constructed a recombinant baculovirus expressing high levels of the herpes simplex virus type 1 (HSV-1) glycoprotein L (gL) in Sf9 cells. Sf9 cells infected with this recombinant virus synthesized three polypeptides of 26-27 kDa, 28 kDa, and 31 kDa. The 28 and 31 kDa species were sensitive to tunicamycin and N-glycosidase F (PNGase F) treatment, suggesting that they were glycosylated. As shown by both indirect immunofluorescence and Western blot analysis, using polyclonal antibodies to synthetic gL peptides indicated that the baculovirus expressed gL was abundant on the surface of baculovirus gL infected Sf9 cells. A small fraction of the 31 kDa polypeptide was secreted into the extracellular medium as judged by Western blot analysis. The secreted form of gL was completely resistant to Endoglycosidase H (Endo-H), while the membrane associated form of gL was only partially resistant to Endo-H treatment, suggesting that the secreted gL represented a subpopulation of the membrane bound gL. Mice vaccinated with baculovirus expressed gL produced serum antibodies that reacted with authentic HSV-1 gL. However, these mice produced no HSV-1 neutralizing antibody (titer < 1:10) and they were not protected from lethal intraperitoneal or lethal ocular challenge with HSV-1. Thus, when used as a vaccine in the mouse model, gL, similar to our findings with HSV-1 gH, but unlike our results with the other 6 HSV-1 glycoproteins that we have expressed in this baculovirus system, did not provide any protection against HSV-1 challenge.

FULL-TEXT ARTICLE Link

DNA immunization confers protective immunity on mice challenged intravaginally with herpes simplex virus type 2.

Bourne N, Milligan GN, Schleiss MR, Bernstein DI, Stanberry LR.

Children's Hospital Medical Center, Department of Pediatrics, University of Cincinnati College of Medicine, OH 45229, USA.

The immunogenicity and protective efficacy of a nucleic acid vaccine encoding the herpes simplex virus type 1 (HSV-1) glycoprotein D (gD) gene under the control of the CMV immediate early gene promoter was examined. Mice immunized three times by intramuscular injection with the vaccine developed an HSV specific IgG but not IgA antibody response detectable in both serum and vaginal secretions. In addition, antigen-specific cellular immune responses were detected in splenic lymphocytes isolated from DNA immunized animals. Immunization reduced virus replication in the genital tract following a lethal intravaginal HSV-2 challenge. Furthermore, symptomatic genital HSV disease was reduced in immunized mice and the animals were completely protected from death. We conclude that a nucleic acid vaccine expressing HSV-1 gD induced both humoral and cell mediated immune responses in mice which proved highly protective against disease following virus challenge.

PMID: 8961510 [PubMed - indexed for MEDLINE]
